

Solarspot[®] D-38 versus SunPipe[®] 450 and Solatube[®] 290DS

To help see through all of the sales jargon and technical smoke-screen generated by some light pipe manufacturers, we asked the Building Research Establishment (BRE) to test the Solarspot system against the comparable offerings from Monodraught and Solatube. The results from this highly respected and independent body should give you all the information that you need when deciding on which tubular daylight system is right for you and your project. See the results in the table to the right.

So why is the performance of the Solarspot significantly greater than that of its rivals? It's all in the technology:

The Solarspot[®] dome

The dome is completely clear, allowing the maximum amount of light to enter the tube without interference from 'so-called' light harvesting prismatic lenses which can actually block out more than they capture, and in the Solatube, actually designed to do this*.

RIR[™] Light Funnel

To maximise light capture in the Solarspot, we use our patented RIR light funnel technology. At the start and end of the day, the RIR reflects low-level light into the system. As the sun gets higher in the sky, or on overcast days, there are no obstructions to light entering the top of the tube – maximising light capture in all weather conditions.

Vegalux[®] light transfer technology

With an unsurpassed light reflectivity of 99.7%, our Vegalux tubing and extension systems are able to deliver more light, for longer distances than any other tubular daylight system.

Buying with confidence - more daylight for your next project

No other system will deliver as much light to your home through an equivalent size or length of pipe and that's a fact.

No other system offers you such a complete package of patented light capture and delivery technology, making it Europe's number one system for maximum daylight delivery.

Fully assembled kits – saving valuable time and money on site?

Time is money is probably never truer than in construction. To speed up your daylight installation, Solarspot systems are supplied with fully assembled top and bottom sections, you just need to join the extension tubes. This means that the roof can be weather tight in minutes from the flashing being fitted, saving you time, money and the risk of a hurried installation causing later leaks in the roof.

Solarspot, no hard sell – just hard facts

SunPipe
450

Solarspot
D-38

Solatube
290DS

In conclusion – from the BRE report:

Taking the 3 double/single glazed tubes, the Solarspot with Convax lens product had the highest transmittance, 0.57, compared to 0.43 for the Monodraught and 0.40 for the Solatube. In relative terms, it was 33% more effective than the Monodraught at transmitting light, and 44% more effective than the Solatube*.
